

**Project Design Phase**  
**Solution Architecture**

Date	June 2025
Team ID	LTVIP2025TMID50838
Project Name	ResolveNow: Your Platform for Online Complaints
Maximum Marks	4 Marks

**Solution Architecture Overview:**

The ResolveNow system follows a client-server-based architecture using the **MERN stack (MongoDB, Express.js, React.js, Node.js)**. The architecture bridges user interface requirements with backend logic and database storage, ensuring real-time communication, efficient complaint tracking, and modular code management.

---

**Architecture Layers:**

**1. Frontend (Client Layer):**

- **Technology:** React.js with Bootstrap & Material UI
- **Role:**
  - User-facing interface for complaint registration and tracking
  - Role-based access (Admin, User, Agent)
  - Axios used for API calls
  - Real-time dark/light theme toggle
  - Chat UI for interaction with agents

**2. Backend (Application Layer):**

- **Technology:** Node.js with Express.js
- **Role:**
  - Handles REST API endpoints
  - Authentication and session management
  - Complaint routing logic
  - Connects frontend to database

**3. Database (Storage Layer):**

- **Technology:** MongoDB Atlas (Cloud-hosted NoSQL DB)
- **Role:**

- Stores user profiles, complaints, status updates, chat history, and agent/admin data
- Document-based structure for flexibility and scalability

#### **4. Optional Integration:**

- Socket.io (For Real-Time Messaging)
- Email/SMS Gateway (For notifications)

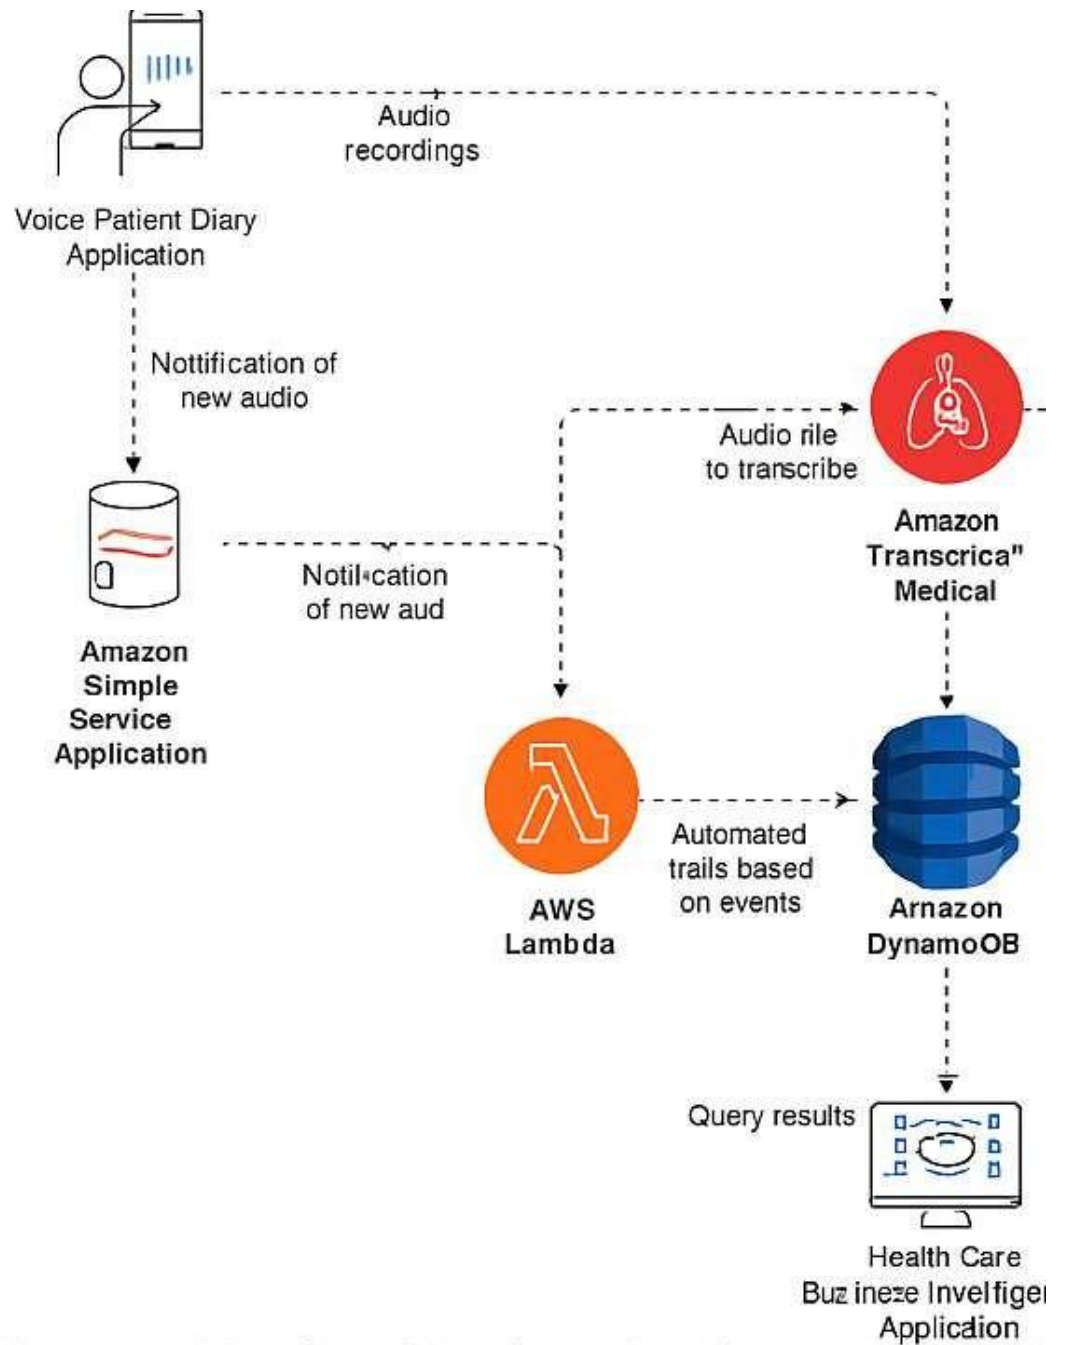

---

#### **Data Flow Overview:**

1. **User Sign Up/Login:** User credentials are sent from frontend to backend, verified, and stored in MongoDB.
2. **Complaint Submission:** User submits a complaint, which is stored in the database and visible to admins.
3. **Assignment:** Admin assigns complaint to agent based on workload.
4. **Chat:** User and agent communicate in real-time (via chat module).
5. **Tracking:** Complaint status is updated by agents/admins and reflected on user dashboard.
